

WHAT IS CLAIMED IS:

1. A process for providing an intercontinental power grid distribution system using the interstate highway system for the mass distribution of energy products including petroleum, gas, electricity, gasoline, and fiber optics, comprising

placing energy product supply lines below the ground surface of the median of an interstate highway and the right-of-ways immediately adjacent the interstate highway, the energy product supply lines supplying energy products selected from the group consisting of petroleum, gas, gasoline, fiber optics and electricity,

connecting each supply line to a source of an energy product,

connecting each supply line to an outlet line extending at an angle below the ground such for supplying distributors and end users with an energy product.

2. The process as defined in claim 1 wherein the energy product is petroleum, providing pumping stations for each petroleum supply line and interconnecting each petroleum supply line to a pumping station for maintaining the pressure in the petroleum supply line.
